

Channel HTML Contextual Compare

Module Installation

- For installation, you will need an html editor.
- It is recommended you have some knowledge of HTML to install this module.
- All styles have been wrapped in a `.channel-html` selector. This will automatically prevent any conflicts with existing CSS on your site.

Note: This module has a maximum width constraint applied. It will not expand to fill 100% of its parent container if the container exceeds this maximum width. When implementing or positioning this module, do not rely on it stretching to fill the entire container. Instead, design with the max-width in mind.

Module Components

- HEAD - CSS
- BODY - Markup

Step 1 - HEAD - CSS

1. CSS exist within a single `<style>` tag inside of `<head>` .
2. Copy the `<style>` tag and paste it in the `<head>` tag of your own webpage.

Step 2 - BODY - Markup

1. You should still have the modules `index.html` open in your html editor.
2. In `index.html` find the `<channel-html>` node (it is the only HTML node in the `<body>`).
3. Copy the `<channel-html>` node.
4. In your own webpage, find a target element/container which will hold our module.
5. Place the copied markup within this target element.

Step 3 - Images

If the supplied folders of `/images/` can be copied to your system, and remain in the same directory as your `index.html` file, then they should all appear on the page.

If not, or if they cannot be hosted here, then you can alter image file paths in step 2.

At this point the page should be ready to preview.
